

(2) 
$$\varphi(\varphi(\vec{v})) = \varphi(\vec{v})$$
 \* (e) dum  $\varphi^2 = \varphi$ )

 $y : m(\varphi) = V^2$ 

Si sabernos \* del Jona artion

 $Tr(\varphi) = dim(in(\varphi)) = dim(V^4)$ 
 $Tr(\frac{1}{2} = \frac{1}{2} =$ 

Dados X X cómo calculamos X Hom (V, W) Reauda que como neps Hom (V, W) = V\* & W  $\chi(g) = \chi(g) = \chi(g) \circ \chi(g)$ Hom  $(V, w) V^* \otimes W$  $=\frac{\chi(g)\cdot\chi(g)}{W}$ Asi que de Générios (W. Sw) sur reps  $dim\left(Hom_{q}(V,W)\right) = \frac{1}{141} \underbrace{\sum_{g \in q} \chi_{g} \chi_{g}}_{q} \chi_{w}(g)$ Caolinio: Si V. Vx son neps medicibles distritos de G entonces las praines XVI, XVz, ..., X.Vk son un conjuto ortanormal en Fun (4 4)  $(f_{u}(q, q), \langle \rangle) \langle f, h \rangle := \frac{1}{141969} \frac{1}{969} \frac{1}{9} h (g)$ 

dim (H) = # de clases de conjugación

For a foromatidad XV, ..., Xve sor In. 17dep. que dim (X,.., Xe) = k "= => k < # de clases de conjugación. < 20
